

# Continuous Probability Distributions

MGMT 670: Business Analytics

Mitchell E. Daniels, Jr.  
School of Business

MGMT 670

1

## Continuous Random Variable

- Assumes any value in an interval or a collection of intervals on the real line

What is the probability that the dean will call me exactly at 11:01 pm tonight?

- Is it possible to define the probability of the continuous random variable?

What is the probability that the dean will call me between 11:00 and 11:05 pm?

- The probability for continuous random variables is defined for an interval.

MGMT 670

2

## Continuous Probability Density Function

- Informally, a smoothed histogram, showing relative frequencies,  $f(x)$ , of all values of the random variable,  $X$ .

However,  $f(x)$  is not probability.

- Properties of the probability density function (pdf)

$$\int_{-\infty}^{+\infty} f(x)dx = 1, \quad f(x) \geq 0$$

MGMT 670

3

## Probability of Continuous Random Variable

$$P(x_1 \leq X \leq x_2) = \int_{x_1}^{x_2} f(x)dx$$

Probability is the area under curve!

Properties of the probability density function

$$\int_{-\infty}^{+\infty} f(x)dx = 1, \quad f(x) \geq 0$$

MGMT 670

4

## Example: Uniform Distribution

Select a random number between 0 and 1

$X$  is uniform random variable from the interval  $[0,1]$

$f(x) = 1$  for all  $x$  in  $[0,1]$

$$P\left(\frac{1}{3} \leq X \leq \frac{2}{3}\right) = ?$$

## Normal Probability Distribution

- Describes many continuous random processes or phenomena.
- Can be used to approximate some discrete probability distributions such as Binomial.
- Basis for classical statistical inference.

## Normal Probability Density Function

- Normal Probability Density Function (PDF)

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}$$

Don't tattoo this!!!

where:

$x$  = value of random variable ( $-\infty \leq x \leq \infty$ )

$\mu$  = mean

$\sigma$  = standard deviation

$\pi = 3.14159$

$e = 2.71828$

## Characteristics of Normal Probability Distribution

- The Normal Probability Density Function (PDF)

- Bell-shaped and symmetric
- Mean, median, and mode are equal.
- Infinite Range

## Parameters of Normal Probability Distribution

For a normal population, if we know the mean and standard deviation, we have the complete information about the population.

MGMT 670

9

## Some Common Intervals of Normal Probability Distribution

MGMT 670

10

## Why normal distributions?

Many distributions in real life

- Travel time by air plane from Chicago to NYC
- People heights
- Number of customers in a department store
- Number of daily visitors of a website
- ...

MGMT 670

11

## Employee Performance Evaluation

MGMT 670

12

# Normal Probability

- Probability is the area under curve.

MGMT 670

13

## Standard Normal Probability Distribution

- Normal distribution with a mean of zero and a standard deviation of one.
- $Z$  is commonly used to designate the standardized normal random variable.

- Conversion rule

$$z = \frac{x - \mu}{\sigma}$$

- Measures the number of standard deviations the value  $x$  is from  $\mu$ .

MGMT 670

14

## Example

A junk stock's return is a normal distribution with mean 5, standard deviation 10 (in percentage).

We write its as either  $N(5, 10^2)$  or  $N(5, 10)$

What is the probability that the return is between 5 and 17.5 this month?

## Standardization Example

$$P(5 \leq X \leq 17.5)$$

$$z = \frac{5 - 5}{10} = 0.0$$

$$z = \frac{17.5 - 5}{10} = 1.25$$

$$P(0 \leq Z \leq 1.25)$$

## Using Table to Find Normal Probabilities

- Standardize, then use standard normal table.

$$P(5 \leq X \leq 17.5) =$$

$$P\left(\frac{5 - \mu}{\sigma} \leq \frac{X - \mu}{\sigma} \leq \frac{17.5 - \mu}{\sigma}\right)$$

$$= P\left(\frac{5 - 5}{10} \leq \frac{X - 5}{10} \leq \frac{17.5 - 5}{10}\right)$$

$$= P(0 \leq Z \leq 1.25)$$

$$= P(Z \leq 1.25) - P(Z \leq 0) \Rightarrow \text{Normal Z Table}$$

## Cumulative Standard Normal Probability Table

$$P(5 \leq X \leq 17.5) = P(0 \leq Z \leq 1.25)$$

$$= P(Z \leq 1.25) - P(Z \leq 0) = .8944 - 0.5 = 0.3944$$

| z   | 0.00   | 0.01   | 0.02   | 0.03   | 0.04   | 0.05   | 0.06   | 0.07   | 0.08   | 0.09   |

| 1.4 | 0.9192 | 0.9207 | 0.9222 | 0.9236 | 0.9251 | 0.9265 | 0.9279 | 0.9292 | 0.9306 | 0.9319 |

## Finding Probabilities Using Normal Tables

- Cumulative Standard Normal Table gives the shaded area

$$P(a \leq Z \leq b) = P(Z \leq b) - P(Z \leq a)$$

- Standard normal table gives the following area under z

## Using Excel Functions

- Excel has two functions for computing probabilities for normal distributions:

- NORM.S.DIST** is used to compute the cumulative probability given a z value.

$$P(Z \leq z) = \text{NORM.S.DIST}(z, \text{TRUE})$$

- NORM.DIST** is used to compute the cumulative probability for x given a mean of  $\mu$  and standard deviation of  $\sigma$ .

$$P(X \leq x) = \text{NORM.DIST}(x, \mu, \sigma, \text{TRUE})$$

## Using Excel Functions

- Using **NORM.S.DIST**  
 $P(0 \leq Z \leq 1.25)$   
 $= \text{NORM.S.DIST}(1.25, \text{TRUE}) - \text{NORM.S.DIST}(0, \text{TRUE})$   
 $= 0.8944 - 0.5$   
 $= 0.3944$
- Using **NORM.DIST**  
 $P(5 \leq X \leq 17.5)$   
 $= \text{NORM.DIST}(17.5, 5, 10, \text{TRUE}) - \text{NORM.DIST}(5, 5, 10, \text{TRUE})$   
 $= 0.8944 - 0.5$   
 $= 0.3944$

## Exercise

The flight time from Chicago O'Hare (ORD) to Purdue University (LAF) is approximately normally distributed with a mean of 60 minutes and a standard deviation of 8 minutes. What's the probability that a randomly selected flight has a duration:  
 Between 55 and 65 minutes?

Longer than 70 minutes?

Why are these results useful?

## Exercise

- Your professor's exam scores are normally distributed with a mean of 80 and a standard deviation of 8. What's the probability that you'll score above 90? (Are you aiming too high?) And what's the probability that you'll score below 60?

## Finding z-Value for a Known Cumulative Probability

## Using Standard Normal Table

$$P(Z \leq z) = 0.75$$

$$\rightarrow z \approx 0.675$$

| z   | 0.00   | 0.01   | 0.02   | 0.03   | 0.04   | 0.05   | 0.06   | 0.07   | 0.08   | 0.09   |
|-----|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0.0 | 0.5000 | 0.5040 | 0.5080 | 0.5120 | 0.5160 | 0.5199 | 0.5239 | 0.5279 | 0.5319 | 0.5359 |
| 0.1 | 0.5398 | 0.5438 | 0.5478 | 0.5517 | 0.5557 | 0.5596 | 0.5636 | 0.5675 | 0.5714 | 0.5753 |
| 0.2 | 0.5793 | 0.5832 | 0.5871 | 0.5910 | 0.5948 | 0.5987 | 0.6026 | 0.6064 | 0.6103 | 0.6141 |
| 0.3 | 0.6179 | 0.6217 | 0.6255 | 0.6293 | 0.6331 | 0.6368 | 0.6406 | 0.6443 | 0.6480 | 0.6517 |
| 0.4 | 0.6554 | 0.6591 | 0.6628 | 0.6664 | 0.6700 | 0.6736 | 0.6772 | 0.6808 | 0.6844 | 0.6879 |
| 0.5 | 0.6915 | 0.6950 | 0.6985 | 0.7019 | 0.7054 | 0.7088 | 0.7123 | 0.7157 | 0.7190 | 0.7224 |
| 0.6 | 0.7257 | 0.7291 | 0.7324 | 0.7357 | 0.7389 | 0.7422 | 0.7454 | 0.7486 | 0.7517 | 0.7549 |
| 0.7 | 0.7580 | 0.7611 | 0.7642 | 0.7673 | 0.7704 | 0.7734 | 0.7764 | 0.7794 | 0.7823 | 0.7852 |
| 0.8 | 0.7881 | 0.7910 | 0.7939 | 0.7967 | 0.7995 | 0.8023 | 0.8051 | 0.8078 | 0.8106 | 0.8133 |
| 0.9 | 0.8159 | 0.8186 | 0.8212 | 0.8238 | 0.8264 | 0.8289 | 0.8315 | 0.8340 | 0.8365 | 0.8389 |
| 1.0 | 0.8413 | 0.8438 | 0.8461 | 0.8485 | 0.8508 | 0.8531 | 0.8554 | 0.8577 | 0.8599 | 0.8621 |
| 1.1 | 0.8643 | 0.8665 | 0.8686 | 0.8708 | 0.8729 | 0.8749 | 0.8770 | 0.8790 | 0.8810 | 0.8830 |
| 1.2 | 0.8849 | 0.8869 | 0.8888 | 0.8907 | 0.8925 | 0.8944 | 0.8962 | 0.8980 | 0.8997 | 0.9015 |
| 1.3 | 0.9032 | 0.9049 | 0.9066 | 0.9082 | 0.9099 | 0.9115 | 0.9131 | 0.9147 | 0.9162 | 0.9177 |
| 1.4 | 0.9192 | 0.9207 | 0.9222 | 0.9236 | 0.9251 | 0.9265 | 0.9279 | 0.9292 | 0.9306 | 0.9319 |

MGMT 670

25

## Exercise

- Your total sleep time per night is normally distributed with a mean of 8 hours and a standard deviation of 1 hour. After several late nights during finals, you decide that you need to sleep at least as much as the top 10% of your normal nights. How many hours of sleep should you aim for? (Time to put your phone away!)

## Using Excel Functions

- Excel has two functions for finding  $z$ - or  $x$ -value for normal distributions:

- **NORM.S.INV** is used to find the  $z$ -value given a cumulative probability  $p$ .

$$\text{NORM.S.INV}(p) = z \text{ such that } P(Z \leq z) = p$$

$$z = \text{NORM.S.INV}(0.75) = 0.674$$

- **NORM.INV** is used to find the  $x$ -value given a cumulative probability  $p$ , a mean of  $\mu$  and standard deviation of  $\sigma$ .

$$\text{NORM.INV}(p, \mu, \sigma) = x \text{ such that } P(X \leq x) = p$$

TOOLS & SOFTWARE

MGMT 670

26

## Exercise

The flight time from Chicago O'Hare (ORD) to Purdue University (LAF) is approximately normally distributed with a mean of 60 minutes and a standard deviation of 8 minutes. The middle 90% of flights will have durations between what two values?

## Exercise

Pep Zone sells auto parts and supplies, including a popular multi-grade motor oil. The store uses a replenishment policy: place an order when the stock of this oil drops to 13 gallons. When an order is placed, it takes 1 day (the lead time) before the new shipment arrives. During this 1-day lead time, customer demand for the oil is normally distributed with mean 10 gallons and standard deviation 3 gallons.

a. What is the probability of a stock-out?

b. What should the reorder point be if Pep Zone wants the probability of a stock-out during the lead time to be only 5%?

## Normal Approximation of Binomial Probabilities

- When the number of trials,  $n$ , becomes large the normal probability distribution provides an easy-to-use approximation of binomial probabilities

where  $n > 20$ ,  $np \geq 5$ , and  $n(1 - p) \geq 5$ .

- Set  $\mu = np$ ;  $\sigma = \sqrt{np(1 - p)}$
- Add and subtract a **continuity correction factor** because a continuous distribution is being used to approximate a discrete distribution. For example,

$P(x = 10)$  is approximated by  $P(9.5 \leq x \leq 10.5)$ .

MGMT 670

30

## Normal Approximation of Binomial Probabilities

For a binomial distribution **Binomial(n,p)**, when the number of trials,  $n$ , becomes large:

Its distribution looks like normal distribution

## Normal Approximation to the Binomial Distribution

When  $X \sim \text{Binomial}(n, p)$ , the exact distribution can be approximated by a Normal distribution when  $n$  is large and  $p$  is not too close to 0 or 1:

$$X \approx N(\mu = np, \sigma^2 = np(1 - p)).$$

Because  $X$  is discrete and the Normal is continuous, we apply a **continuity correction**:

- To approximate  $P(X = k)$ , use  $P(k - 0.5 < Y < k + 0.5)$ , where  $Y \sim N(\mu, \sigma^2)$ .
- To approximate  $P(X \leq k)$ , use  $P(Y < k + 0.5)$ .
- To approximate  $P(X \geq k)$ , use  $P(Y > k - 0.5)$ .

Alice's sale per week Binomial(30, .4)

<https://stats.shinyapps.io/BinomialDist/>

## Example

$n = 100, p = .4$ . Find  $P(30 \leq x \leq 50)$

- Using the binomial distribution, the result is?

Check:  $np \geq 5, n(1-p) \geq 5, n \geq 20$ .

- Using the normal approximation,

$$P(29.5 \leq x \leq 50.5) = ?$$

## Case Study: Portfolio Returns

### Portfolio Returns

- Consider the problem of designing portfolios
- The investment manager is considering stocks of Exxon, General Motors, IBM, P&G, Pfizer and FedEx
- He wants to invest \$100,000 in these stocks and would like to find the portfolio that is likely to give good returns and not pose too much risk.
- How should he do this?

### Collect Data

| Date       | Exxon Mobil | General Motors | IBM   | P&G   | Pfizer | FedEx |
|------------|-------------|----------------|-------|-------|--------|-------|
| 1/31/1995  | 15.63       | 30.56          | 18.03 | 16.15 | 6.81   | 15.19 |

37

## Modern Portfolio Theory (Mean-Variance Analysis)

Let  $w_1, w_2, w_3, w_4, w_5, w_6$  represent the weights of Exxon, GM, IBM, P&G, Pfizer, and FedEx in the portfolio, respectively.

### 2. Objective Function:

Maximize the expected portfolio return:

$$\text{Maximize } R_p = w_1R_1 + w_2R_2 + w_3R_3 + w_4R_4 + w_5R_5 + w_6R_6$$

where  $R_p$  is the expected return of the portfolio, and  $R_i$  is the expected return of stock  $i$  for  $i = 1, 2, 3, 4, 5, 6$ .

### 3. Risk (Variance) Constraint:

Ensure the portfolio risk is below a specified threshold  $\sigma_{\max}^2$ :

$$\text{Variance } (\sigma_p^2) = \sum_{i=1}^6 \sum_{j=1}^6 w_i w_j \sigma_{ij} \leq \sigma_{\max}^2$$

where  $\sigma_{ij}$  is the covariance between stock  $i$  and stock  $j$ .

39

## Behavior of returns in future ...

- Assume returns will be random from bell-shaped distribution
  - reasonable as long as mean is significantly bigger than std. deviation (typical for short-term analysis)
- Assume that the correlations remain as before
  - caveat: history may not be enough to predict future
- Then, find the portfolio that maximizes return while not incurring “too much risk”

38

## Modern Portfolio Theory (Mean-Variance Analysis)

$$\text{Maximize } R_p = w_1R_1 + w_2R_2 + w_3R_3 + w_4R_4 + w_5R_5 + w_6R_6$$

Subject to:

$$\sigma_p^2 = \sum_{i=1}^6 \sum_{j=1}^6 w_i w_j \sigma_{ij} \leq \sigma_{\max}^2$$

$$\sum_{i=1}^6 w_i = 1$$

$$w_i \geq 0 \quad \text{for } i = 1, 2, 3, 4, 5, 6$$

Economist Harry Markowitz introduced MPT in a 1952 essay, for which he was later awarded a Nobel Memorial Prize in Economic Sciences.

Distribution for Return/I20

50000 monthly simulations

41

## Return on Investment

- The portfolio monthly return follows a normal distribution with a mean return of 1.0166 and a standard deviation of 0.05055. What is the probability that the investor will lose money?

$P(\text{Monthly rate of return} < 1)$

$$\text{Standardize 1: } \frac{1 - \mu}{\sigma} = \frac{1 - 1.0166}{0.05055} = -0.3277$$

$$P(R < 1) = P(Z < -0.3277) \approx 1 - 0.6293 = 0.3707$$

42

## Exercise : ROI

$$P(Z < -0.3277) = 1.0 - 0.6293 = 0.3707$$

$$= \text{Norm.s.dist}(-0.3277)$$

or

$$= \text{Norm.dist}(1, 1.0166, 0.05055, 1)$$

43

## Return on Investment

- In 95% of the cases, the return on investment will exceed what value?

Find  $x$  such that  $P(\text{Monthly rate of return} > x) = 0.95$

$$P(R > x) = 0.95$$

What is this return value?

44

## Return on Investment

- Convert the statement in terms of standard normal distribution

Find the  $z$  such that standard normal variable is larger than  $z$  with 95% probability

$z_{0.05}$ : Look inside normal table for 0.95

$z_{0.05} \approx 1.645$

So, we are looking for  $-1.645$

What is the corresponding return?

$$R = \mu + (-z_{0.05})\sigma = 1.0166 - 1.645 \times 0.05055 = 0.9334$$

What is the  $z$ -value?  $-z_{0.05}$

## Exercise : Return on Investment

- $P(Z \leq z) = 1 - P(Z > z) = 1 - 0.95 = 0.05$

$$z_{.95} = \text{NORM.S.INV}(0.05) = -1.645$$

- Or from the table:  $P(Z < z) = 0.95 \rightarrow z_{.05} \approx 1.645 \rightarrow z_{.95} \approx -1.645$

| z   | 0.00   | 0.01   | 0.02   | 0.03   | 0.04   | 0.05   | 0.06   | 0.07   | 0.08   | 0.09   |
