Analytics and Machine Learning

Project Overview

Objective: Transform receivables management processes from human-driven → AI-driven workflows

Focus Areas:

- Risk & revenue management processes
- Credit accuracy monitoring
- KPI reporting automation
- Revenue assurance workflows

Target:

- Improve efficiency
 - Reduce manual work
 - Enable data-driven decision making
- 
- 

Business Problem & Need

Manual AR matching, dispute handling, and risk review delay cash collection and increase operational cost in large enterprises, specifically:

- High-volume payments require manual remittance investigation and invoice matching.
- Disputes are handled reactively, increasing cycle time and operational overhead.
- Risk segmentation for bad-debt reserves remains judgment-heavy and inconsistent.

Client Challenges:

- Repetitive Manual Matching
 - Reactive Dispute Management
 - Subjective Risk Segmentation
- 

Approach

Phase 1 — Process Analysis

- Reviewed existing workflow process flows
- Identified pain points and inefficiencies (Root Cause Analysis)
- Mapped current workflow steps

Phase 2 — AI Solution Design

- Behavioral insights agent
- Incorrect credit detection agent
- KPI reporting automation
- Revenue assurance monitoring

Phase 3 — Process Redesign & Evaluation

- Shifted steps from manual → AI-driven
 - Defined impact on human roles
 - Designed future workflow model
 - Prototype testing
 - Performance measurement
 - Feedback collection
- 

Solution Design

AI Overlay Framework

Defined variables for each process:

- What task the AI agent performs
- Where it fits in workflow
- How process logic changes
- Impact on human roles
- Level of automation (manual → AI-driven)

Resulting Improvements:

- Automated credit validation
 - Predictive risk monitoring
 - Real-time KPI tracking
 - Reduced manual intervention
- 
- 

AI Agents

1. **Accounts Receivable Agent**

The goal of the agent is to match and clear incoming payments, reducing manual investigation effort up to 90%.

2. **Dispute Resolution Agent**

The goal of the agent is to scan invoices for errors automatically along with detecting incorrect charges and suggesting fixes.

3. **Behavioral Insights Agent**

The goal of the agent is to analyze historical financial behavior, disputes and exposure patterns to predict late payments and default risk.

Impact & Value

- AI agents significantly improve financial process efficiency by automating repetitive tasks.
- The system shifts finance roles from manual investigation to strategic oversight and decision making.
- Despite automation, human expertise remains essential for:
 - Handling exceptions
 - Validating AI recommendations
 - Critical financial decisions

Thank
You
